Sankey chart

The Sankey flowchart allows you to visualize the logical flow between either two or three variables of your choice. **The selected variables should be categorical, with few values.** However, unlike other types of categorical charts (e.g., Sunburst or Treemap), the number of values in the variables is not so crucial.

The Sankey GUI

In the `dta_visualizaion_1` GUI, tick the 'Visualize relations' checkbox and select the Sankey option from the dropdown menu. You can choose a first CSV file field, click the + widget to add another one, and a third for a 3-way flowchart.

You can also specify the number of the most frequent values for each CSV file field you'd like to see: 5 or 10 for the first variable, 5, 10 or 20 for the second variable and 5, 10, 20 or 30 for the third variable. **The larger the number of values displayed and the messier the chart may get.**

Sankey interactive graph

The Sankey chart is displayed as an html, interactive file. You can run your mouse over the boxes or the lines for more information. For example, by hovering over the value “we,” the number of values available will be displayed (1.82k, i.e., 1820), the number of elements to the left (0) and to the right (12) in the flowchart. The lines connecting the selected element (“we”) to other elements in the chart will also be highlighted.

In a Sankey chart the thickness of connecting lines reflects the frequency of values in the interaction.

Question: Why don't the lines highlight?

You click on “it” and none of the lines connecting “it” to other elements are highlighted. The reason is that the number of values for “it,” 17, is very small, compared to “we,” and the connecting lines are too thin to be visualized.

Moving elements around in the chart area

To better visualize relations between elements in the chart, when you hover over an element, e.g., “it,” you can grab it with the mouse and move it around in the chart area.

The problem is that when you release the mouse, the element goes back to its original position in the chart.

Locking elements in a new position in the chart area

To ensure that the new position for an element is saved, while holding the mouse down on a moved element, hit the fn key+any key to save the new position.
